Abstract	6
Declaration	8
Publications	9
Abbreviations	10
Acknowledgements	11
Chapter 1: Introduction	12
1.1 Enzyme secretion by filamentous fungi	12
1.2 Applications of fungal enzymes in biotechnology	13
1.3 Prospecting for new enzymes	16
1.4 Coprophilous fungi	18
1.5 Koala faeces: a unique and recalcitrant substrate	19
1.6 Isolation and identification of fungi	21
1.6.1 Isolation of fungi from faeces	21
1.6.2 Morphological identification of fungi	22
1.6.3 Molecular identification techniques	24
1.6.3.1 Restriction Fragment Length Polymorphism (RFLP)	25
1.6.3.2 Random Amplified Polymorphic DNA (RAPD)	25
1.6.3.3 Sequencing based on conserved and variable regions of rDNA	25
1.7 Investigation of enzyme activity	27
1.7.1 Screening by agar plate assay	27
1.7.2 Liquid cultures	28
1.7.3 Liquid enzyme assays	29
1.7.4 Zymography	31
1.8 Plant cell wall constituents and enzymes involved in their degradation	32
1.8.1 Cellulose	34
1.8.2 Hemicellulose: xyloglucan, xylan and mannan	35
1.8.3 Pectin	37
1.8.4 Side chains of hemicellulose and pectin	39
1.8.5 Lignin	40
1.8.6 Enzyme synergism	42

1.9 Fungal secretomes: extracellular insights into efficient substrate utilisation	43
1.9.1 Fungal secretomes that have been explored	43
1.9.2 The secretome of a well studied fungus- <i>Trichoderma reesei</i>	45
1.9.3 Exploring the secretome: methods of analysis	48
1.9.3.1 Gel electrophoresis	48
1.9.3.2 Mass spectrometry	49
1.9.3.3 Protein identification from mass spectra	51
1.10 Aims of this study	54
Chapter 2: Materials and methods	55
Chapter 3: Isolation and identification of fungi from koala faeces and screening for their enzyme activities of biotechnological interest	56
3.1 Introduction	56
3.2 Publication 1: Peterson R.A., Bradner J.R., Roberts T.H. and Nevalainen K.M.H. 2009. Fungi from koala (<i>Phascolarctos cinereus</i>) faeces exhibit a broad range of enzyme activities against recalcitrant substrates. Letters in Applied Microbiology. 48, 218-225.	58
3.3 Additional details of methods described in Publication 1	66
3.3.1 Extraction of genomic DNA	66
3.3.2 PCR amplification of ITS regions	66
3.3.3 Preparation of PCR product for Big Dye Terminator sequencing	67
3.3.4 Analysis of ITS sequences	67
3.3.5 Calculation of relative enzyme activity	68
3.4 Results and Discussion	69
3.4.1 The collection of koala faeces and preparations for incubation	69
3.4.2 Incubation of koala faeces for fungal growth	70
3.4.3 Isolation of fungi	73
3.4.4 Identification of fungi by morphology	75
3.4.5 Identification of fungi by ITS sequencing	80
3.4.6 Comparison of the ITS regions of the fungal isolates using ClustalW	82
3.4.7 A potential new species of <i>Mucoraceae</i> from koala faeces	84
3.4.8 Screening of fungi for enzyme activity by agar plate assay	87
3.4.8.1 Detection of enzyme activity on solid media	87
3.4.8.2 Temperatures of incubation	89
3.4.8.3 Relative Enzyme Activity	90

3.4.9 Basidiomycetous yeast identified from koala faeces	102
3.5 Selection of fungal isolates for further enzyme characterisation	104
3.6 Summary	105
Chapter 4: Cultivation of selected fungal isolates from koala faeces in liquid media for further enzyme characterisation	107
4.1 Introduction	107
4.2 Publication 2: Peterson, R., Grinyer, J., Nevalainen, H. 2011. Extracellular hydrolase profiles of fungi isolated from koala faeces invite biotechnological interest. <i>Mycological Progress</i> . 10, 207-218.	109
Supplementary material for Publication 2	122
4.3 Methods additional to those contained in Publication 2	139
4.3.1 Carbohydrate esterase zymogram	139
4.3.2 Cultivation of fungal strains in oxidase-inducing liquid medium	139
4.3.3 Assay for laccase activity	140
4.4 Results and Discussion	141
4.4.1 Carbohydrate esterase activities assessed by zymogram analysis	141
4.4.2 Growth of fungi in oxidase-inducing media and screening for laccase activity	142
4.4.3 The value of the agar plate assays as a predictor of enzyme activities in the hydrolase-inducing liquid medium	145
4.5 Summary	147
Chapter 5: The secretome of <i>Doratomyces stemonitis</i> C8, isolated from koala faeces	149
5.1 Introduction	149
5.2 Publication 3: Peterson, R., Grinyer, J., Joss, J., Khan, A., Nevalainen, H. 2009. Fungal proteins with mannanase activity identified directly from a Congo Red stained zymogram by mass spectrometry. <i>Journal of Microbiological Methods</i> . 79, 374-377.	151
5.3 Publication 4: Peterson, R., Grinyer, J., Nevalainen, H. 2011. The secretome of the coprophilous fungus <i>Doratomyces stemonitis</i> C8, isolated from koala faeces. <i>Applied and Environmental Microbiology</i> . 77, 3793-3801.	157
5.4 Further discussion of the work described in Publication 4	167
5.4.1 Proteins identified in the <i>D. stemonitis</i> C8 secretome and their relationship to assayed enzyme activities	167

5.4.2 Evaluation of the methods used to identify proteins in the <i>D. stemonitis</i> C8 secretome	168
5.4.3 Comparisons between the secretome of <i>D. stemonitis</i> C8 and the secretomes of other fungal species	171
5.4.4 The identification of enzymes in the secretome of <i>D. stemonitis</i> C8 with potential for industrial application	173
5.5 Summary	175
Chapter 6: Main findings and future prospects	176
6.1 Main findings	176
6.2 Future prospects	179
6.2.1 The development of novel enzymes for industrial applications	179
6.2.1.1 Strain improvement	180
6.2.1.2 Gene isolation and recombinant expression	180
6.2.2 A world of coprophilous fungi awaits attention	182
References	184
Appendix 1. Supplementary material for Publication 4	212

Abstract

Filamentous fungi secrete enzymes to break down complex substances in the environment into smaller molecules they can use for nutrition. Investigation of the enzymes secreted by a fungus can lead to a better understanding of how it survives in a natural habitat; furthermore, new enzymes with potential for industrial applications can be revealed. In this work, the enzyme activities of fungi from koala faeces were investigated. As a result of a diet of *Eucalyptus* leaves, koala faeces are composed of recalcitrant plant cell wall polymers (cellulose, hemicellulose, pectin and lignin). Consequently, fungi that grow on koala faeces hold high potential as sources of enzymes for efficient degradation of plant biomass.

Thirty-seven fungal strains were isolated from koala faeces, identified, and screened for enzyme activities using agar plate assays; over two-thirds of the isolates secreted xylanases, endoglucanases, ligninases and proteases, and over one-third secreted amylases, mannanases and tannases. The enzyme activities of seven isolates were comprehensively characterised using liquid cultures, liquid enzyme assays and zymography. Two isolates, *Gelasinospora cratophora* A10 and *Trichoderma atroviride* A2, were high secretors of protein and heat-tolerant enzymes. The lipase(s) from *Mariannaea camptospora* A11 sustained activity at cool temperatures. The xylanase(s), mannanase(s), endoglucanase(s) and β -glucosidase(s) of *Doratomyces stemonitis* C8 displayed optimal activities under neutral to alkaline conditions. Some of the enzymes hold potential for application in the production of paper, textiles, detergents and ethanol-based biofuels.

Finally, the secretome of *D. stemonitis* C8 was studied by gel electrophoresis and mass spectrometry. As the genome of *D. stemonitis* has not been sequenced, the secretome analysis required cross-species identification and *de novo* sequencing; furthermore, a new technique was developed to identify proteins directly from zymogram gels by mass spectrometry. In the

first secretome analysis of a coprophilous fungus, a complex array of enzymes integral to plant biomass degradation was identified, including enzymes that could be of value to industry in the future.

Declaration

I certify that the research presented in this thesis is original work carried out by the author. The work has not been presented for a higher degree to any university or institution other than Macquarie University, and contains no material previously published or written by any other person except where due reference is made in the text.

Robyn Peterson

Publications

The following publications resulted from the work carried out for this thesis. Each of the publications are introduced, presented and discussed in turn throughout the thesis chapters. Additional work, not included in the publications, is also described.

Publication 1:

Peterson, R.A., Bradner, J.R., Roberts, T.H., Nevalainen, K.M.H., 2009. Fungi from koala (*Phascolarctos cinereus*) faeces exhibit a broad range of enzyme activities against recalcitrant substrates. *Letters in Applied Microbiology*. 48, 218-225.

Publication 2:

Peterson, R., Grinyer, J., Nevalainen, H., 2011. Extracellular hydrolase profiles of fungi isolated from koala faeces invite biotechnological interest. *Mycological Progress*. 10, 207-218.

Publication 3:

Acknowledgements

I am very thankful to Macquarie University and the funding provided by a Macquarie University Research Excellence Scholarship (MQRES) for making this research possible.

There are also many people I would like to thank for making my PhD candidature such a rewarding and fulfilling experience. First and foremost, I am extremely grateful to my supervisors Professor Helena Nevalainen, Doctor Tom Roberts and Doctor Jasmine Grinyer. Helena, thank you for providing the highest level of excellence in terms of research opportunity and supervision. Thank you too for your compassionate support when things were rough; you helped me to achieve my best and strive towards my goals, whatever came my way. Sydänlämpimät kiitokset sinulle Helena. Tom, thank you for your expert advice, for always finding time to have a chat, and for keeping me on track. Jasmine, words seem inadequate to fully express my gratitude to you. Your friendship has helped me through my own personal doubts and fears; your supervision and expertise in proteomics have been invaluable; your compassion and sense of humour have helped me to put things in perspective and kept me sane. Thank you.

A special thank you must also go to the staff of the Australian Proteome Analysis Facility (APAF) for their kind assistance, always delivered with a smile and a lot of patience! Thank you Janice, Alamgir, Matthew and Dylan. Thank you too to all my friends in the laboratory who have made coming to university so enjoyable. Thank you Liisa for the many times you have patiently taught me skills in the lab, for the friendship and the laughter that we have shared, for your good company in the early morning hours. Thank you Angela and Jenny for our great conversations and cups of tea, and for reminding me of how to be young. Thank you Elsa, Hana, Clara, Suja, Jashan, Zoe, Shingo, Raj, Arun, Mick, Anwar, Moreland, Junior, Bridget, Maria, Jenny, Marie, Teresa, Catherine, and everyone else I met along the way!

Finally I would like to express my deepest gratitude to my parents. The support you provided me through difficult years helped me to turn my life around and to achieve “the impossible”.
